

DRUVAN G N

Backend Software Engineer

Mysuru, India | druvangurukar20@gmail.com | +91 63619 67951 | [Portfolio](#) | [LinkedIn](#) | [GitHub](#) | [LeetCode](#)

SUMMARY

Backend engineer focused on distributed, event-driven systems and API design under evolving business rules — building REST APIs and microservices in Java/Spring Boot and Python/FastAPI, and modeling long-running workflows as explicit, recoverable state machines (LangGraph checkpointing, human-in-the-loop review gates). Comfortable owning a system end-to-end: system design, authentication/authorization (JWT, OAuth, OWASP), data layers, and cloud deployment (GCP). Currently building a production multi-agent platform at Hashedin by Deloitte; drawn to problems in reliability, correctness, and scale.

CORE SKILLS

Backend & Systems: Java · Spring Boot · Python · FastAPI · .NET/C# · REST APIs · Microservices Architecture · System Design · Distributed Systems · Event-Driven Architecture (Kafka) · State Machines / Workflow Orchestration (LangGraph)

Reliability & Security: JWT / OAuth · OWASP Security · Idempotency & Retry Handling · Checkpointed, Recoverable Workflows · Observability (LangSmith)

Data & Infra: SQL · MySQL · PySpark · ChromaDB · Docker · Git/GitHub · Jenkins · CI/CD · GCP

Applied AI: LangChain · LangGraph · RAG · Multi-Agent Systems · Deep Agents

EXPERIENCE

Trainee Engineer (SDE1) — Hashedin by Deloitte

April 2026 – Present | Mysuru, India

[ETL Migration Intelligence System](#) — Java, LangChain, LangGraph, Deep Agents, PySpark, GCP, ChromaDB, LangSmith

- Core contributor on a multi-agent AI platform automating legacy ETL modernization for enterprise data pipelines on GCP — each stage runs as a discrete, observable agent step rather than one monolithic job.
- Built the retrieval layer on PySpark and ChromaDB and instrumented the system end-to-end with LangSmith, so every agent decision is traceable — the same observability discipline reliability-critical backends need.

[AI Agent Factory](#) — FastAPI, LangGraph, WebSockets, SSE, ChromaDB, SQLite

- Designed a document-to-code pipeline covering three distinct agentic workflows, each modeled as an explicit, recoverable state machine rather than a single request/response call.
- Built the human-in-the-loop review layer (WebSockets, SSE streaming) and state persistence (LangGraph checkpointing) so long-running tasks can pause for review and resume reliably after a failure or restart — the same pause/resume/retry pattern distributed backends rely on.

[FoodieHub](#) — .NET 8, C#, JWT, OWASP

- Independently designed and built a food-delivery backend end-to-end in .NET 8/C#, from data modeling through deployment, handling business rules that change per order state (assignment, batching, cancellation).
- Implemented JWT authentication, role-based access control, and OWASP-compliant security hardening across all API endpoints.

[Smartwatch Leaderboard System](#) — Spring Boot, Java 17, Kafka, MySQL, JPA

- Owned the backend for a real-time leaderboard service, designing the event-driven data flow (Kafka) for device feature-tag matching and geo-scoped challenges — concurrent writes, consistent reads.
- Integrated the service with an Angular 20 + NgRx front end, exposing a clean REST contract consumed by a separate client team.

ADDITIONAL PROJECT

[Job Portal — Full-Stack Web App](#) — Java, JDBC, MySQL, React

- Full-stack job portal (team of 8) with secure auth and role-based access for employers/seekers; optimized backend REST APIs for ~40% faster response times, validated with 30+ test users.

EDUCATION

B.E., Computer Science (AI & ML) — Vidyavardhaka College of Engineering, Mysore

2022 – 2026 | CGPA: 9.5

CERTIFICATIONS

Python for Data Science & Machine Learning (IBM) · MySQL Database Development (Udemy) · Database Connectivity in Java / JDBC (SimpliLearn)
